Own your hotel's workflow 

Smart lock hardware — \$150 AUD per lock

IronLogic HMS platform — \$30 AUD per room / month

IDEAL FOR:

- Hotels
- Motels
- Serviced apartments
- Remote accommodation sites
- Properties aiming to reduce concierge overheads

WHAT'S INCLUDED

Key Benefits for Operators

- **NewBook-connected booking sync** — keep reservations aligned automatically across supported booking channels.
- **Guest self-check-in portal** — streamline arrival and reduce manual check-in handling.
- **ID and facial verification** — add an extra layer of guest validation before issuing access.
- **Stripe payment finalisation** — collect outstanding payments securely before check-in is completed.
- **Automatic lock code delivery** — send time-bound room access without manual setup.
- **Cloud dashboard visibility** — manage lock status and guest access activity from one platform.

WHY IRONLOGIC HMS

➤ Automated guest onboarding

- Guests can complete check-in remotely before arrival, reducing front-desk workload and enabling a concierge-free operation.

➤ Integrated self check-in

- Booking details are synced from NewBook-connected channels, and guests are guided through booking confirmation, consent, ID verification, payment finalisation and code delivery in a single flow.

➤ Secure access delivery

- Once guest details are verified and payment is complete, a unique access code is generated for the duration of the stay and issued directly to the room lock. After checkout, the code is removed from the system for security.

➤ Cloud-based management

- Hotel staff can manage locks, bookings, access events and guest activity remotely through IronLogic's cloud platform, which already supports centralised device status monitoring, event logs and reporting across sites.

➤ Built for connected properties

- The system can work alongside IronLogic access control and SMARTCAM systems, allowing hotels to unify room access, common-area access, parking workflows and security monitoring in one ecosystem.

HOW GUEST SELF-CHECK-IN WORKS

➤ From booking confirmation to room access, guests complete the process before arrival from their device.

1. Booking Confirmation

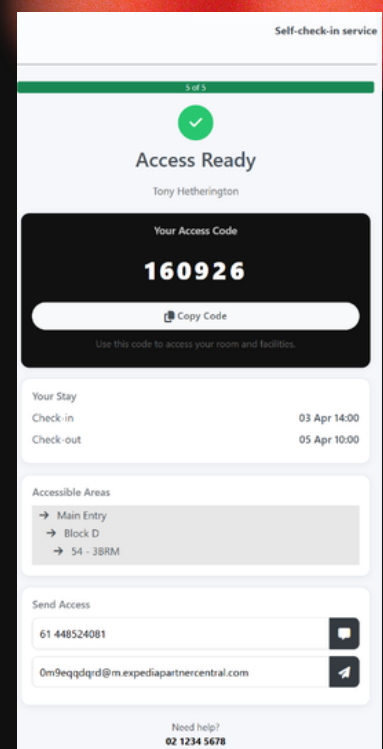

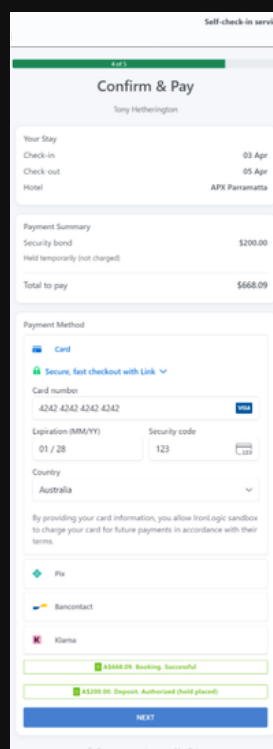

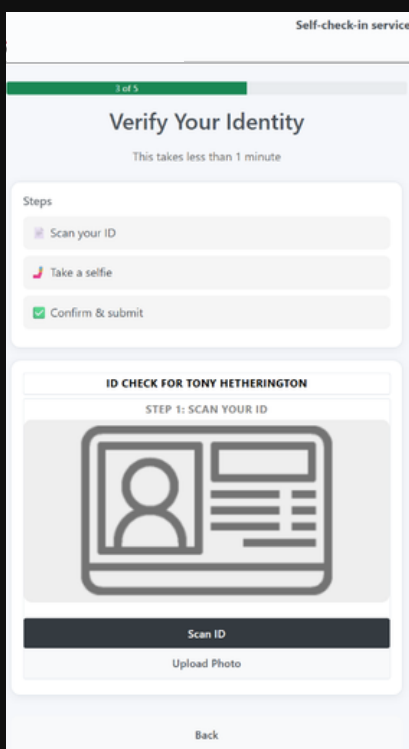

Reservations from NewBook-connected channels are synced into the system in real time. Guests enter their first name, last name and booking number, and the system checks the booking using either the NewBook ID or supported third-party reference numbers.

2. Payment Completion

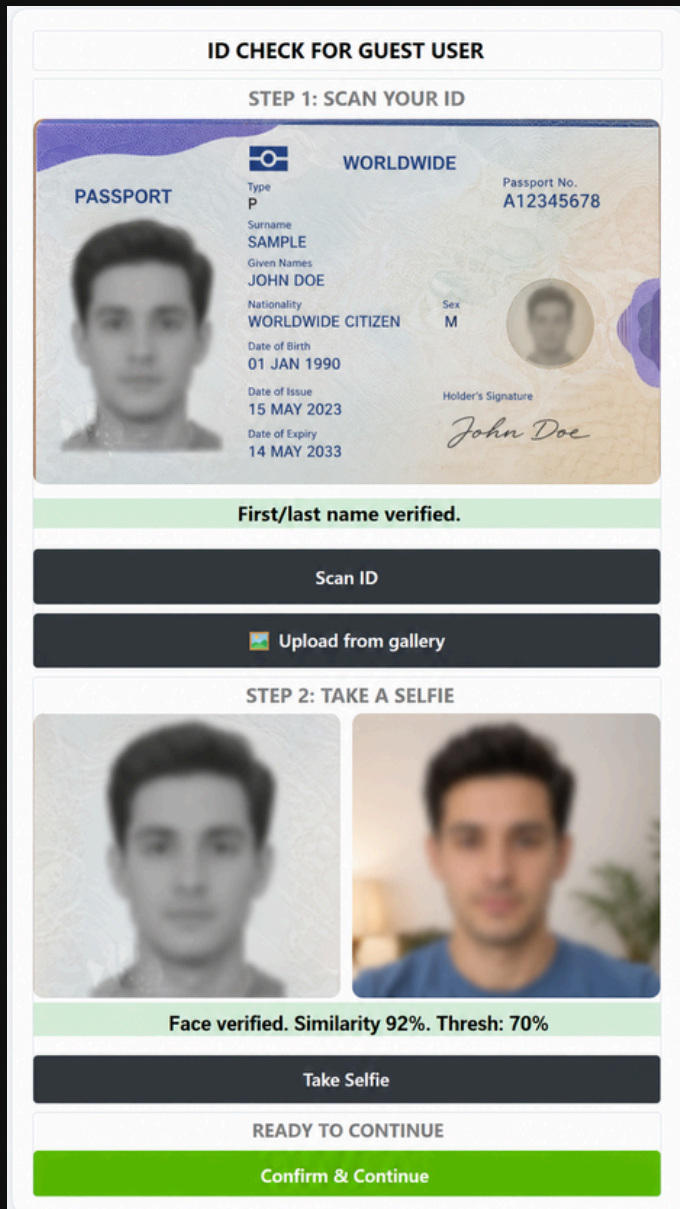

If payment or bond is still outstanding, guests can finalise it securely through Stripe before arrival. Receipts and transaction records remain available for review through the platform.

3. Access Issued Automatically

Once verification and payment are complete, the guest receives a unique access code valid for the duration of their stay. The code can be used for the guest's room and authorised common areas, then removed automatically once access expires.

BUILT-IN ID & FACE VERIFICATION

Document Scan & Detection

Guests scan or upload a passport, driver licence or other supported photo ID. The system detects the document in the image stream and prepares it for automated analysis.

Text Detection & Booking Match

The document is analysed and key text fields are read automatically. First and last name details are checked against the booking information before the guest proceeds.

Face Recognition Verification

After the ID is processed, the guest is prompted to take a selfie. The selfie is then cross-checked against the photo on the ID as part of the identity verification workflow.

Configurable Verification Settings

Face-match thresholds and identity-verification settings can be adjusted in the control panel to suit the property's workflow and operational requirements.

ONE PLATFORM FOR HOTEL OPERATIONS

➤ Smart lock management

- Battery-powered smart locks connect over Wi-Fi and are visible through the IronLogic dashboard, where operators can monitor status, control devices and review events.

➤ Cloud visibility

- IronLogic's cloud environment supports live device status, centralised event logs, remote management and reporting across multiple sites and controllers.

➤ Access control integration

- Hotels can extend the system beyond guest rooms by connecting common areas, staff-only zones, lifts, gates or shared amenities to IronLogic's access control platform. IronLogic's platform is built for remote management of controllers, users and permissions.

➤ SMARTCAM integration

- Properties can also integrate IronLogic SMARTCAM for additional automation and oversight, including event visibility, cloud-connected monitoring and licence plate recognition for garages or guest parking workflows. SmartCam is designed to integrate with IronLogic access control and consolidated event management.

➤ Built for scale

- IronLogic's cloud tools support multi-site visibility, system logs, reporting and API connectivity, making the platform suitable for single properties or broader accommodation groups.
